## AIR SYSTEMS

Titus Air Systems, as with so many companies before it, started when opportunity knocked. Officially launched in 2008, the move into manufacturing was precipitated by an offer from Air Products and Chemicals, Inc. for Titus to take over the manufacturing and support of what was previously known as the Prism brand of membrane nitrogen generation systems.

Titus Air Systems' parent company, The Titus Company, has long been one of Air Products' largest distributors of membrane dryers to industrial, commercial and governmental markets. The move made sense because The Titus Company had long been a trusted partner and promoter of membrane technology, and it was committed to revolutionizing the industrial gas drying and nitrogen generation fields. The product transfer has worked beautifully.

The Titus Company started life as a manufacturer's representative with the C.M. Kemp Manufacturing Company in 1986. At the time Kemp was a major supplier of compressed air and gas drying systems, and Steve Titus had worked for Kemp for almost 10 years at the time he started The Titus Company. His knowledge of both Kemp's products and the markets they served led to the rapid development of The Titus Company as a major industrial distributor in eastern Pennsylvania, New Jersey and Delaware. Eventually, The Titus Company became a full service distributor for air compressors and air treatment products in these

markets. This success coupled with the opportunity presented by Air Products' made the decision to expand into a manufacturing operation an easy one.

Since 2008 Titus Air Systems has ascended rapidly to become one of the most respected and innovative companies in the compressed air and gas dehydration and nitrogen generation markets. They have done this with a staff that brings 20+ years of experience on average to the industry. From application engineering to product design and fabrication, Titus Air Systems brings a wealth of expertise to the markets it serves. With award winning designs such as the TNX Series Expandable Nitrogen Generators and their turn-key skid mount or containerized systems, Titus is able to take on even the most demanding compressed air dehydration or nitrogen generation applications.

With the launch of several new technologies, including pressure swing adsorption systems, Titus has now moved into markets as diverse as laboratory, food & beverage, naval & merchant marine, chemical & petrochemical, nuclear, and pharmaceutical. Recent offerings focus on supplying dry air or nitrogen for food packaging, tank blanketing, laser cutting, purging and altitude chambers. The sales growth experienced has led to an expansion of the manufacturing facilities and the addition of more engineering and fabrication personnel. Titus Air Systems is proud to be a thriving manufacturing business in southeastern Pennsylvania.

For any and all compressed air or gas needs, Titus Air Systems has a cost effective & efficient solution. Contact James Bowers at 888.722.5253 or James.Bowers@TitusAir.com with any questions that you might have.
